

processor includes a decode unit to decode a packed sum of absolute differences (PSAD) instruction having an opcode format to identify a set of packed data operands. The decode unit initiates a sequence of operations on the set of packed data operands in response to decoding the PSAD instruction. An execution unit performs a first operation of the sequence of operations initiated by the decode logic, and a bus provides the execution unit with the set of packed data operands as identified in accordance with the opcode format.

IN THE CLAIMS

Presented below are the amended claims in a clean, unmarked format.

16. (New) A processor comprising:

a decode unit to decode a plurality of packed data instructions including a packed sum of absolute differences (PSAD) instruction having a first format to identify a first set of packed data, and a packed multiply-add (PMAD) instruction having a second format to identify a second set of packed data, said decode unit to initiate a first set of operations on the first set of packed data responsive to decoding the PSAD instruction and to initiate a second set of operations on the second set of packed data responsive to decoding the PMAD instruction; and

an execution unit to perform a first operation of the first set of operations initiated by the decode unit and to perform a second operation of the second set of operations initiated by the decode unit.

17. (New) The processor of Claim 16, wherein the decode unit further decodes a plurality of instructions of a PENTIUM microprocessor instruction set.

18. (New) The processor of Claim 16, wherein the first set of operations comprises:

- a packed subtract and write carry (PSBWC) operation;
- a packed absolute value and read carry (PABSRC) operation; and
- a packed add horizontal (PADDH) operation.

19. (New) The processor of Claim 16, wherein performing the first operation causes the execution unit to:

subtract one of a plurality of elements of a first packed data of the first set of packed data from a corresponding one of a plurality of elements of a second packed data of the first set of packed data to produce a first result having a plurality of difference elements and a plurality of sign indicators.

20. (New) The processor of Claim 19, wherein the first format identifies the first set of packed data as packed bytes.

21. (New) The processor of Claim 16, wherein performing the first operation causes the execution unit to:

produce a first plurality of partial products in a multiplier having a plurality of partial product selectors;

insert an element of a first plurality of elements of a first packed data into and substituting for bit positions of one or more of the first plurality of partial products by using partial product selectors corresponding to the bit positions; and

add the first plurality of elements together to produce a first result including a field comprising a sum of the first plurality of elements, said field having a least significant bit.

22. (New) The processor of Claim 21, wherein performing the first operation further causes the execution unit to:

shift the first result to produce a second result having a least significant bit position and to align the least significant bit of the field with the least significant bit position of the second result.

23. (New) The processor of Claim 21, wherein performing the second operation causes the execution unit to:

produce a second plurality of partial products in the multiplier having the plurality of partial product selectors, the second plurality of partial products comprising four distinct sets of partial products including a first set of partial products corresponding to a first product for elements of the second set of packed data, a second set of partial products corresponding to a second

product for elements of the second set of packed data, a third set of partial products corresponding to a third product for elements of the second set of packed data, and a fourth set of partial products corresponding to a fourth product for elements of the second set of packed data; and

add the first set of partial products together with the second set of partial products to produce a first distinct element of a packed result and add the third set of partial products together with the fourth set of partial products to produce a second distinct element of the packed result.

24. (New) The processor of Claim 23, wherein the second format identifies the second set of packed data as packed words.

25. (New) The processor of Claim 16, wherein performing the first operation causes the execution unit to:

receive a plurality of difference elements and a plurality of sign indicators;

produce a result data having a plurality of absolute value elements, each absolute value element produced by

(a) subtracting one of the plurality of difference elements from a corresponding constant value if the sign indicator corresponding to that element is in a first state, or

(b) adding one of the plurality of difference elements to a corresponding

constant value if the sign indicator corresponding to that element is in a second state.

26. (New) A processor to execute instructions of the PENTIUM microprocessor instruction set, the processor comprising:

decode logic to decode a packed sum of absolute differences (PSAD) instruction having a first format to identify a first set of packed data, said decode logic to initiate a first set of operations on the first set of packed data responsive to decoding the PSAD instruction;

execution logic to perform a first operation of the first set of operations initiated by the decode logic; and

a bus to provide the first set of packed data to the execution logic for performing of the first operation.

27. (New) The processor of Claim 26, wherein the decode logic comprises a look-up table.

28. (New) The processor of Claim 26, wherein the decode logic comprises integrated circuitry.

29. (New) The processor of Claim 28, wherein the decode logic further comprises executable operations.

30. (New) The processor of Claim 29, wherein the decode logic comprises:
a packed subtract and write carry (PSBWC) operation;
a packed absolute value and read carry (PABSRC) operation; and
a packed add horizontal (PADDH) operation.

31. (New) The processor of Claim 26, wherein the first format identifies the first set of packed data as packed bytes.

32. (New) The processor of Claim 31, wherein performing the first operation causes the execution logic to:

subtract one of a plurality of elements of a first packed data of the first set of packed data from a corresponding one of a plurality of elements of a second packed data of the first set of packed data to produce a first result having a plurality of difference elements and a plurality of sign indicators; and
store the plurality of difference elements and the plurality of sign indicators.

33. (New) The processor of Claim 26, wherein performing the first operation causes the execution logic to:

produce a first plurality of partial products in a multiplier having a plurality of partial product selectors;

insert an element of a first plurality of elements of a first packed data into and substituting for bit positions of one or more of the first plurality of

partial products by using partial product selectors corresponding to the bit positions; and

add the first plurality of elements together to produce a first result including a field comprising a sum of the first plurality of elements, said field having a least significant bit.

34. (New) The processor of Claim 33, wherein performing the first operation further causes the execution logic to:

shift the first result to produce a second result having a least significant bit position and to align the least significant bit of the field with the least significant bit position of the second result.

35. (New) The processor of Claim 26, the decode unit to decode a packed multiply-add (PMAD) instruction having a second format to identify a second set of packed data, said decode unit to initiate a second set of operations on the second set of packed data responsive to decoding the PMAD instruction.

36. (New) The processor of Claim 35, execution unit to perform a second operation of the second set of operations initiated by the decode unit.

37. (New) The processor of Claim 35, wherein the second format identifies the second set of packed data as packed words.

38. (New) The processor of Claim 26, wherein performing the first operation causes the execution logic to:

receive a plurality of difference elements and a plurality of sign indicators;

produce a result data having a plurality of absolute value elements, each absolute value element produced by

(a) subtracting one of the plurality of difference elements from a corresponding constant value if the sign indicator corresponding to that element is in a first state, or

(b) adding one of the plurality of difference elements to a corresponding constant value if the sign indicator corresponding to that element is in a second state.

39. (New) A processor comprising:

decode logic to decode a packed sum of absolute differences (PSAD) instruction having a first format to identify a first set of packed data, said decode logic to initiate a first set of operations on the first set of packed data responsive to decoding the PSAD instruction, the first set of operations comprising:

a packed subtract and write carry (PSUBWC) operation;

a packed absolute value and read carry (PABSRC) operation; and

a packed add horizontal (PADDH) operation.; and

execution logic to perform the first set of operations initiated by the decode logic.

40. (New) The processor of Claim 39, wherein the first format identifies the first set of packed data as packed bytes.

41. (New) The processor of Claim 39, wherein performing the PSUBWC operation causes the execution logic to:

subtract one of a plurality of elements of a first packed data of the first set of packed data from a corresponding one of a plurality of elements of a second packed data of the first set of packed data to produce a first result having a plurality of difference elements and a plurality of sign indicators; and store the plurality of difference elements and the plurality of sign indicators.

42. (New) The processor of Claim 39, wherein performing the PABSRC operation causes the execution logic to:

receive a plurality of difference elements and a plurality of sign indicators;

produce a result data having a plurality of absolute value elements, each absolute value element produced by

(a) subtracting one of the plurality of difference elements from a corresponding constant value if the sign indicator corresponding to that

element is in a first state, or

(b) adding one of the plurality of difference elements to a corresponding constant value if the sign indicator corresponding to that element is in a second state.

43. (New) The processor of Claim 39, wherein performing the PADDH operation causes the execution logic to:

produce a first plurality of partial products in a multiplier having a plurality of partial product selectors;

insert an element of a first plurality of elements of a first packed data into and substituting for bit positions of one or more of the first plurality of partial products by using partial product selectors corresponding to the bit positions; and

add the first plurality of elements together to produce a first result including a field comprising a sum of the first plurality of elements, said field having a least significant bit.

44. (New) The processor of Claim 43, wherein performing the PADDH operation further causes the execution logic to:

shift the first result to produce a second result having a least significant bit position and to align the least significant bit of the field with the least significant bit position of the second result.
